

EXPLORATION THROUGH RESEARCH

- Since the last time you wrote about your research, what did you find out? Did your driving question or topic change? Why or why not?
- Now that you are in the "student-led research" part of the process, which student-led research option are you doing? (Survey, interview of an expert, observation, or experiment) Why?
- What has been easy and what has been difficult about this process?
- In your next steps, what do you need to do to make sure you successfully complete this component of the project? What are some things you need to do?
- How is your collaboration going so far? What is working well and not working well?

Since the last time I did research I found out that skin lightening has changed a lot through time and people still continue to lighten their skin because light skin is considered beautiful. My driving question and my topic did change because before we were not sure of what our topic should have been nor our driving question but then we came together with all our resources and came up with our topic and got help with our driving question. We are doing the survey for the student led research because the survey would help us compare our results and see what people think on skin lightening. It has been easy to actually do the work because this topic interests me because it helps me understand how people think. It has been hard to find accurate sources. I think I need to manage my time and try to fit more time in for symposium and also try to fit more time to do our project. My collaboration with my partner is going well and the project is working well but finding time that fits both of us has been a challenge.
